

SIMPLICITY THAT INTE

The Athon XS test instrument made by Starlane is so powerful that it is also its simplest one: we are talking about **Athon XS**, which has been studied and made to limit complications on mounting it on karts.

There is very little wiring harness, but maximum functions. Just think it integrates the Gps system, with which you not only calculate the position on the track but also speed: consequently, it almost becomes pointless having a sensor on with relative cables on the axle and having to set it according to the circumference of the tyres.

Furthermore it can download any data

onto any USB pen drive, so there is no need to take a pc along with you to the track. And finally remember that the Gps system works at 10 Hertz instead of 5 (that is, it verifies position 10 times a second), therefore it is more accurate.

The right led warns you when your best time has been improved, while the upper ones can be set with alarm for temperature or anything else.

Starlane Athon XS can be extended connecting it to other sensors, but already in the XS-K version made for karters come included with water temperature sensor and the relative manifold, a feeler with thermo coupling for exhaust gas and an external battery holder shell.

GRATES EVERYTHING

The latter is for feeding the instrument only if the kart hasn't got its own battery. This packet all included costs 650 euros + VAT.

All the characteristics can be found on www.starlane.it website and DigiRace-MMX instruction software and analysis downloaded.

ATHON XS-K

220 GRAMS ALL YOU NEED TO GET:

- time and split time to 1/100 of a second with aims that can be personified
- paths
- effective speed by GPS
- acceleration
- engine revs
- exhaust gas temperature
- water temperature

DOWNLOADS DATA ON ANY USB PEN DRIVE

Takes Time and Split time with satellite system with a 1/100 of a second resolution, without using magnetic bands you can position split time to improve driver's performance.
